## Introduction

Along with the excitement of competition and the pleasure of social activity that chess brings to our lives, there is also the joy of intellectual challenge. We all want to get better at it. There is something deeply satisfying about seeing our skill and knowledge grow.

The aim of this book is to show you everything you need to be working on to become a better player. Tactics, strategy, and the endgame are covered in detail, and you are offered guidance on subjects such as calculation, analysing your games, and choosing your openings.

Don't expect to understand everything straight away as some of the material is hard: fiendishly hard. It is meant to get you thinking and pushing forwards at the limits of your understanding. But just as the Romans trained with heavier weapons than those used in battle, your task in your own games will seem much lighter after analysing the combinations and strategy of the great players.

It's not my intention to be a lifestyle guru. But we both know that exercise, a balanced diet, and a regular routine during tournaments will be of benefit to your chess. When world champion Magnus Carlsen was asked by an interviewer if he was afraid for his title because an upcoming player was spending sixteen hours a day or more studying chess, he replied laconically: "He should get more sleep." There are many games by the great Magnus presented here, but that is the most useful thing you will learn from him.

I hope that this book will spur you on to devise your own study plan. This will mean making time not only to look at openings, but also to solve chess puzzles, annotate your own games, learn about chess history and the great masters, read books about the endgame, practice calculation by selecting complicated positions to analyse to death, and so on. The more work you put in the better (while remembering Carlsen's admonition!).

Let me wish you luck in your quest to learn more about the mysteries of chess.
Neil McDonald, Gravesend, Kent,

February 2019

## Chapter Three <br> Teaching Yourself to Calculate

Most of the time players are focusing on their plans. As they carry them out they might look a couple of moves ahead to make sure they aren't going to fall for any of the traps outlined earlier in this book. Similarly, they will be alert to any unexpected tactical chances if their opponent slips up. But the emphasis is on the role of calculation, if it occurs at all, as a kind of blunder check. It reassures them that the path they are taking is a safe one.

That changes when we reach scenarios like those discussed in the previous chapters. Tactical sparks begin to fly when the two armies are locked in close combat. The pieces will fight to the death to defend their king and will employ all the tricks at their disposal. Suddenly calculation is not only necessary, you have to find something special. You can't rely on common sense any more.

Usually there is a key move on which the success of a combination depends. We have to use our powers of calculation to find it. Five factors come into play:

1. How unusual or otherwise difficult to see is the key move?
2. How far down a variation is the key move concealed?
3. How long is the combination?
4. How forcing is the combination?
5. How many other variations are obscuring the line with the key move?

In order to find the key move you need both tactical vision and imagination. It doesn't matter if you can calculate ten moves deep if the winning idea escapes your attention because it is counter-intuitive.

## The Key Move is Right There，but Difficult to See

V．Anand－F．Caruana<br>Stavanger 2018

Question：It is White to play．After the game Anand regretted his next move and suggested to his opponent that＂ 36 g 3 would have been about equal．＂ What did Caruana have great pleasure in telling the Indian grandmaster was his intended reply？（See below for the answer－it＇s something special！）

Let＇s see how the game actually continued：
36 睹 18
Aiming to reduce the pressure on the e－file，but：
36．．．鱈f4！
A deadly infiltration and much better than 36．．．

## 37 昆xe8＋曾xe8 38 断d1

## 38．．．孳xh2

Now the white king was in danger and gradually driven out and mated．Anand resigned on move 51.

The refutation of 36 g 3 is easy to calculate once you have become aware of Black＇s first move．But leaving the queen en prise isn＇t intuitive and takes tactical imagination．

## The Position is Cluttered with＂Other＂Variations

Wei Yi－Yu Yangyi<br>Danzhou 2017

It is White to play．Another reminder that there is more to chess analysis than calculat－ ing variations：flair and imagination play a vital part．Before reading on，you might like to analyse the diagram position and try to find the best move for White．

If I was shown this position and asked to find the best move a lot of thoughts would run through my head．My stream of consciousness might be something like this：
＂White＇s bishop is hanging．．．the black king would be mated by C 7 if his bishop on f 5 was eliminated or deflected．．．the black knight is helping to defend $f 5$ but is pinned and can be attacked again by the rook on e3 with gain of time by for the knight attack the black queen．．．宸c4 to attack f7 might be good for White．．．or 昆g3．．．or some trick with

After seeing whether any great idea leapt at me I would attempt to calculate some

 pins the knight on e7 and leaves Black with nothing better than forcing a draw with

 two pieces for a rook after 23．．．曽xe7 24 寞xf5 or does Black have a trick（answer：yes，he does，namely 23．．．寞xh7！，when White＇s discovered check is nothing special after 24 曾xe8＋

when Black is in trouble down the f－file）．Also 22 宸c4 is brushed away by 22．．．宽e6．And fi－
畳h3），it turns out that White has played like a genius just to get a lost game：24．．．崖xe5！ 25 fxe5 葸d3＋ 26 象g1 真xf7 leaves him too much material down for the queen．

That＇s a big jumble of words and numbers．But all the calculation in the world won＇t find you the best continuation in the position unless you hit on the right first move．And if you do hit on the right move，then hardly any calculation is required．Some moves are fiendishly difficult to spot but very easy to work out．And such is the case here with：

## 22 亘h5！

The rook on h1 was almost completely forgotten about in the analysis above．If Black moves his queen to $\mathrm{f6}$ or f 4 ，simply 23 筸xf5 5 wins a piece．If he counter－attacks with $22 \ldots$ ．．．b6
 take on f 5 or d 4 because of 25 D 7 mate．

## 22．．．䀼xh5 23 d7＋

The point of the combination．

## 23．．．蒚xd7 24 宸xh5

Black has nominal material compensation（rook，knight and pawn），but in a middle－ game situation where White has the initiative the queen is undoubtedly to be preferred． Still，Black is fairly solid and White only prevailed on move 64 after a stubborn resistance．

It＇s difficult to judge how many moves you should look at in a given position．Your ex－ perience or chess erudition will tell you（often unconsciously）to weed out（and so avoid wasting time calculating）moves which have no capacity to be good．The danger is that you do too much pruning of possible moves and so never even consider the one which you needed（again，this is likely to happen unconsciously，making it an even harder fault to overcome）．

As always with improving facets of your calculation，the way to get the perfect balance
between too much and too little pruning is practice，practice，and more practice．In a forc－ ing situation the number of potentially good moves is often low．But even here，too much pruning can make you miss the key move．

## D．Navara－N．Grandelius European Cup，Porto Carras 2018

It is White to play（yes，there really is a black knight on f1！）．Navara tried 22 曾e1 but
 Instead，the Czech grandmaster had the spectacular alternative $\mathbf{2 2}$ 断g6．The white queen throws herself at the black defences with the threat of mate in one．

Question：Before reading on，can you list all of Black＇s possible replies and work out what the result should be？

Answer：How many possible replies did you examine？The threat of mate on $\mathrm{g7}$ cuts down Black＇s options．You might begin your analysis by noting to yourself all the pieces hanging： White＇s queen，knight and rook；and Black＇s rook on f8，knight on f1，and g7－pawn．The black rook on c8 isn＇t hanging but is in a standoff with the white rook．

First of all，we should try the move we＇d like to make：

㛫xc4，when the threat of a queen－winning discovered check is decisive） 24 䓪xc8 leaves Black defenceless due to mating threats against his king．For example，24．．．${ }_{\text {une }} \mathrm{e}$（saving the queen from a fork on $g 6$ and threatening mate in one）looks at least okay for Black until

覃h7 30 䍖h8 mate．Moving the queen to other squares than e1 doesn＇t help；e．g．after

2．If we can＇t have the queen let＇s stop mate by taking on e6 with the pawn：22．．．fxe6． This turns out to be totally inadequate after 23 置xe6＋（White can also enter a winning
曾xc8 25 寞f5！（an instructive zwischenzug：the threat of mate forces the black king to 98 where it becomes susceptible to a check on e6）25．．．猡g8 26 䚁xc8 and White is a pawn up
 else 27 㟶e6＋，exchanging queens then picking up the knight．But imagine if the black king were still on h8；i．e．White played 25 置xc8 at once．In that case 25 ．．．単e1 leaves him with

3．Unable to stop mate on $\mathrm{g7}$ by taking queen or knight，it seems we are reduced to de－
 the f7－pawn is still pinned）．This is dismal too，though it＇s a much better chance to draw for
宽xc8 兽xc8 is pretty much forced．After 27 f 3 White has fair chances of winning the end－ game a pawn up．

Well， 22 应 6 is looking good for White．But have we considered all of Black＇s possible moves？

4．There is one we have overlooked：22．．．卛xe6！．

Black＇s queen also puts herself en prise．This even wins for him after 23 息xe6 总xc1．The
 two rooks and a knight for a queen and a pawn，plus a rampant attack on the king，Black wins easily．

I guess Navara had planned 22 隠g6 some way ahead but pruned his calculations one move too much in not considering 22．．．欮xe6！．He therefore had to swerve with 22 㲋e1， when it was too late to save the game．A rare lapse for such a brilliant player．

## The Key Move is Two Moves Deep，and Difficult Enough to Fool a World－class Player

## V．Anand－A．Grischuk <br> Moscow 2018

Question：It＇s White to play．Black has just moved his rook from d8 to g8．
Can you find the short but great combination which clinched for
Anand the game（and also the tournament）？
There is a video of Grischuk＇s face at this point．He looked totally bemused after Anand＇s next move as he hadn＇t seen the idea behind the knight sacrifice．Well，he didn＇t have long to wait in a rapidplay game to find out：

Otherwise the queen is lost．

Note that you can＇t play the moves in the order 27 晹xf7＋？嵝xf7 28 気5＋as Black then has 28 ．．．emx $x 5!29 \mathrm{hxg} 5 \mathrm{~h} 5$.

The hard move was 28 曾xf7＋！．Most players would notice the possibility of 27 g5＋ hxg5 but look at no alternatives other than $28 \mathrm{hxg} 5+$ ？，when 28 ．．．．dg ${ }^{\text {dit }}$ leaves White with nothing for the piece．It takes imagination to see that，despite only having the queen and a pawn on 95 left to attack with，White can mate on h6：the black king is boxed in by his own queen on $f 7$ and rook on 98 ．

Even the strongest players miss resources for themselves and their opponents when
they calculate variations. There is a limit to what is humanly possible and factors such as time pressure and anxiety - or its opposite, overoptimism - make perfection even less likely. Unless your opponent puts up no resistance you are surely going to overlook some things, even in games you win. So don't be too hard on yourself. Everyone makes "inexplicable" oversights. Instead of kicking yourself during a game for missing something, accept this as an inevitable part of chess. Well, I'm giving all this "wise" advice but I have to admit I'm usually less than philosophical when I realize I've made a terrible blunder. It's something we all have to work on.

In the next example the key move is lurking on move two and is also hard to spot.

## Ding Liren-V.Topalov <br> Shamkir 2018

Question: It's Black to play. Before you read on, without moving the pieces have a look at 42... ${ }^{2}$ g4. Try to work out some variations. The move is discussed further below.

Returning to the diagram position, the blocked nature of the pawn structure means that Ding Liren's bishop pair is distinctly underwhelming. Topalov has a bind on the light squares, a protected passed pawn, and a magnificent knight on e4 which can't be evicted by f2-f3 as g3 would drop. It's time for him to strike at the white position.
 b2-square away from the white queen, followed by 44 ...藁c2 with fatal pressure on $f 2$.
 a bit uncomfortable for White but he will be able to edge his king closer to the passed c-
 a draw．

Instead，the sacrifice 42．．． $\mathbf{x f 2}$ ？was played in the game．Black＇s attack proved good enough for equality but no more：

Ding Liren saves himself by exchanging off the black knight．

A sensible decision．Topalov can force a draw by perpetual check any time he wants due to the light square holes in the white position，but he can＇t do better．He would love to get

Answer：The best move for Black is $\mathbf{4 2 . . .} \mathbf{g} \mathbf{g}$ ！
Have you analysed it？White can＇t let the f2－pawn drop for nothing，so he has to accept the piece offer：

## 43 f3 剭b8！

Did you manage to see this tremendously strong retreat by the queen？Now the g3－ point collapses，leaving the white king threadbare．

## 44 fxg4

He has to take the knight that controls the h2－square，otherwise 44 fxe 4 婁 $x g 3+45$ 鼻g2

## 

In the game Ding Liren was able to exchange off his bishop on g2 for the knight on e4 and avoid having his king attacked by any pawns on the kingside．Here his monarch is be－ ing mobbed by the black queen，horse，and rampant pawn on g4．The finish might be：

47 卛b4 g3＋48 象h1
Or 48 氰h 3 稳 55 mate．
48．．．雪e2！
White can do nothing about a killer check on d1．

## The Combination is Long，but the Key Move is Right There and the Play is Forcing

In some cases a variation is long but calculation is helped by the forcing nature of the play． When there are captures，checks and direct threats they simplify your task as they reduce the number of options you need to analyse．

As a young player keen to improve my analytical ability I gathered together a lot of puz－ zles from P．H．Clarke＇s column in the Sunday Times（you might know him as an author of books on Tal and Petrosian）．Here is one of the examples I tried to solve：

## B．Perényi－L．Barczay Hungary 1979

This is the culmination of an attack by Béla Perényi，a Hungarian IM who died tragically young in a car accident in 1988.

Question：It＇s White to move．The black king is trapped in the centre－ how to finish him off？It had better be with some checks，or else Black will get in first with a big check of his own．

I still have＂stream of consciousness＂notes I made on the position when I was 13 or 14 years old．（I treated it like a real game and didn＇t move any pieces in trying to solve the puzzle．）

It＇s clear I was weak both in spotting moves and in choosing the correct order to analyse them．For example，I noticed that Black was threatening 25 ．．．篂a1 mate．Therefore I began

It is totally wrong to begin the analysis with these lines．Instead，I should have started with forcing moves： $25 \mathrm{gxf7}+25$ 亘c8＋，and the queen sacrifice 25 嵝xd7＋．

If one of them turns out to be winning there is no need even to consider 25 bxa3，which is a draw at best for White．You can＇t afford to waste time and energy during a game．Al－ ways start with the forcing moves．

When（much too late）I got onto the attacking moves I began with $25 \mathrm{gxf7}+$ ．One line I
 notes I seem pleased with myself for finding this combination，and justifiably so as it＇s four moves long．But here we see a prejudice in favour of playing moves that capture pieces． Instead， 26 㥪e6 is an immediate mate．My only（and quite valid）excuse is that I had never seen a mate of this kind at the time．

So far so good，but after 25 gxf7＋I couldn＇t crack 25 ．．．畗d8！．And I still can＇t all these

 mate．I remember working out the chase of the black king to a8 very slowly and carefully， making sure there was no way for him to slip out．

But 28．．．睘f6！frustrated me．The black king had found a safe refuge．

The move $25 \mathrm{gxf} 7+$ ？is a blunder because，as discussed above，either the pawn wants to

 move order in analysis，but remember once you＇ve found a forced win during a real game it＇s a bad habit to look for alternatives．）
Answer：In the game Barczay resigned at once after $\mathbf{2 5}$ 嵝xd7＋！．
My analysis in 1981 was far from perfect，but that didn＇t matter．I was picking up tacti－ cal patterns and learning to calculate variations，including the order in which you should consider moves in a sharp position．I hope you also develop the habit of solving puzzles．A few a day could make all the difference．

## The Key Move is a Number of Moves Deep but the Play is Forcing

In the next example Black blunders into a combination by his opponent．The winning move
